

Properties of Triangle

- Q) In $\triangle ABC$, lines through the vertices A, B and C intersect in a common point D. The areas of different triangles in sq. units are as indicated in the diagram. Find the area of $\triangle ABC$.

Solution:

Let AD intersect BC in P, BD intersect CA in Q and CD intersect AB in R.

Let the area of $\triangle CDP$ be 'x' and that of $\triangle ADQ$ be 'y' respectively.

We make use of the following property:

For triangles having bases on the same line and having a common vertex, their areas are in the ratio of their bases.

$$\Rightarrow \frac{x}{35} = \frac{CP}{BP} \dots\dots(i) \quad \text{Bases CP and BP on the same line BC with D as common vertex}$$

$$\Rightarrow \frac{x+84+y}{35+30+40} = \frac{CP}{BP}$$

$$\Rightarrow \frac{x+y+84}{105} = \frac{CP}{BP} \dots\dots(ii) \quad \text{Bases CP and BP on the same line BC and A is common vertex}$$

$$\text{From (i) and (ii), } \frac{x+y+84}{105} = \frac{x}{35}$$

$$\Rightarrow y = 2x - 84 \dots\dots(iii)$$

$$\Rightarrow \text{Again, } \frac{y}{84} = \frac{AQ}{CQ} \dots\dots(iv) \quad \text{Bases AQ and CQ on the same line CA and D is common vertex}$$

$$\Rightarrow \frac{y+40+30}{84+x+35} = \frac{AQ}{CQ}$$

$$\Rightarrow \frac{y+70}{x+119} = \frac{AQ}{CQ} \dots\dots(v) \quad \text{Bases AQ and CQ on the same line CA and B is common vertex}$$

$$\text{From (iv) and (v) } \frac{y+70}{x+119} = \frac{y}{84}$$

$$\Rightarrow 35y + xy = 84x + 70 \dots\dots(vi)$$

$$\text{From (iii) and (vi) } 35y + y\left(\frac{y+84}{2}\right) = 84x + 70$$

$$\Rightarrow y^2 + 154y - (2x + 70 \times 84) = 0$$

$$\Rightarrow (y + 210)(y - 56) = 0$$

$$\Rightarrow y = 56$$

$$\Rightarrow x = 70 \quad \text{From (iii)}$$

$$\Rightarrow \text{Area of } \triangle ABC = 70 + 35 + 30 + 40 + 56 + 84 = 315 \text{ sq. units}$$
